

# DIAMOND TOOL HOLDERS

A diamond tool is only as good as the foundation it is mounted to.

At Contour we take extra care to attached the diamond in the proper orientation when we mount it to the insert or shank.

- The diamond crystal is accurately set so the cutting edge is central to the holder
- A vacuum braze process is used to guarantee good adhesion of the diamond to the base
- Each tool is inspected to guarantee the two above steps have been done properly
- For steel tool holders, the shank is nickel plated to eliminate corrosion
- The sides of solid shank tool holders are ground to ensure the diamond arc is central and square for fast and accurate tool set up for your process

**Here are tool holder options from Contour.**
